Several molecular techniques are then compared using experimental results obtained from a population genetic study of the *Mytilus* complex in the North Atlantic and Mediterranean. Finally, the most appropriate theoretical tools to analyse molecular population genetic data are discussed.

The present paper addresses the data analysis (data collection, analysis by itself, and interpretation) from characterization of plant genetic resources achieved by molecular markers. Increasing number of studies dealing with molecular characterization of plant genetic resources, and large number of possible analysis to choose, justify the present attempt to give a systematic theoretical framework for future studies.

Data Analysis in Molecular Biology and Evolution introduces biologists to DAMBE, a proprietary, user-friendly computer program for molecular data analysis. The unique combination of this book and software will allow biologists not only to understand the rationale behind a variety of computational ...
