All of these points aside, this is a good book and a useful addition to the shelf. It should be in the library (or preferably the lab) of all institutes carrying out DNA fingerprinting in plants. Its reference list is extensive, and it is a source of a wide range of interesting pieces of information.

DNA sequencing is increasingly used either in combination with or as a replacement for traditional DNA fingerprinting techniques. A prime example is the use of short, standardized regions of the genome as taxon barcodes for biological identification of plants.

DNA Fingerprinting – After we isolate the DNA and amplify it with PCR – Treat the DNA with restriction enzymes – cut DNA at specific sequences – Everyone’s DNA is different, so everyone’s DNA will cut at different sites – This results in different sized fragments
