Earths Shifting Surface - maloofx.com

One can hardly doubt that significant shifts of the crust have taken place repeatedly and within a short time." He urged Hapgood to follow up on evidence of "earth fractures". A month later (11 June 1953) Hapgood sent Einstein forty-two pages of evidence on earth fractures and the evolution of the ice sheets.

covertress: Earth's Shifting Crust: Einstein

Hapgood provided a geologic theory, Earth Crust Displacement, which claims that a catastrophic shift of the earth's lithosphere around 10,000 BC. resulted in the continent of Antarctica's site for the lost continent of Atlantis moving from a temperate latitude to its current polar position.

Earths Shifting Crust A Key To Some Basic Problems Of

Shift in Earth's Crust: From the previous descriptions on the potential for a magnetic pole shift and/or a geographic pole shift, you can see that Earth's crust could be in for events that would most certainly be considered cataclysmic. Either of these events would occur quite quickly in geological terms, and therefore, the shifts in Earth's crust would also occur quickly.

Shift In Crust | Possible Earth Events - Timeline To The

Oceanic crust covers about 60 percent of the Earth's surface. Oceanic crust is thin and young -- no more than about 20 km thick and no older than about 180 million years. Everything older has been pulled underneath the continents by subduction. Oceanic crust is born at the mid-ocean ridges, where plates are pulled apart.

The Earth's Crust: Everything You Need to Know

• Lithosphere • The brittle portion of Earth's interior. • Behaves as a non-flowing, rigid material. • The material that moves as tectonic plates. • Made of 2 components: crust and upper mantle. • Asthenosphere • The ductile portion of Earth's interior. • Shallower under oceanic lithosphere. • Deeper under continental lithosphere.

Earth's™ Composition and Structure: A Journey to the Center

In his books *The Earth's Shifting Crust* (1958) (which includes a foreword by Albert Einstein) and *Path of the Pole* (1970), Hapgood speculated that accumulated polar ice mass destabilizes the Earth's rotation, causing crustal displacement but not disturbing the Earth's axial orientation. Hapgood argued that shifts (of no more than 40 degrees) occurred about every 5,000 years, interrupting 20,000- to 30,000-year periods of polar stability.

Pole shift hypothesis - Wikipedia

Earth's Shifting Crust. Our title is identical to that of a book published by C.P. Hapgood in 1958. He also wrote *The Path of the Pole* (1970). Several other authors have also proposed that sudden slippages of the earth's crust caused wild climate fluctuations in the past with devastating biological consequences -- in particular, all those quickfrozen mammoths in Siberia.

Earth's Shifting Crust - Science Frontiers

In 1958 Charles Hapgood suggested that the Earth's crust had undergone repeated displacements and that the geological concepts of continental drift and sea-floor spreading owed their secondary livelihoods to the primary nature of crustal shift.

Earth Crust Displacement - bibliotecapleyades.net

The cataclysmic pole shift hypothesis suggests that there have been geologically rapid shifts in the relative positions of the modern-day geographic locations of the poles and the axis of rotation of the Earth, creating calamities such as floods and tectonic events.

Charles Hapgood "The Earth's™ Shifting Crust. In 1958, Hapgood published *The Earth's™ Shifting Crust* which denied the existence of continental drift and featured a foreword by Albert Einstein. In *Maps of the Ancient Sea Kings* (1966) and *The Path of the Pole* (1970), Hapgood proposed the hypothesis that the Earth's™ axis has shifted numerous times during geological history.

Earth Crust Displacement and the British Establishment

The fact that the magnetic poles are shifting so quickly lends itself to the fact that perhaps something is happening that could cause a rapid shift in the Earth's crust. The reality is that we just don't know.

Evidence for Earth's Crust Shift in 9600 BCE

So even today, parts of the crust that carried heavy ice sheets 20,000 years ago are still slowly rising (an effect known as the 'isostatic rebound' or 'post-glacial rebound').

Why is Earth's axis shifting? | Cosmos

Earth's crust is Earth's hard outer layer. It is less than 1% of Earth's volume. The crust is made up of different types of rocks: igneous, metamorphic, and sedimentary rocks. Below the crust is the mantle. The upper part of the mantle is made up of peridotite, a rock denser than rocks common in the crust. The crust and the upper mantle make up the lithosphere.
