Plastic debris at the micro-, and potentially also the nano-scale, are widespread in the environment. Microplastics have accumulated in oceans and sediments worldwide in recent years, with maximum concentrations reaching 100 000 particles m⁻³. Due to their small size, microplastics may be ingested by low trophic fauna, with uncertain consequences for the health of the organism.

Thermotolerant (faecal) coliforms The term "faecal coliform" has been used in water microbiology to denote coliform organisms which grow at 44 or 44.5 C and ferment lactose to produce acid and gas.
