Sir John Ivan George Cadogan HonFREng CBE FRS FRSE FRSC PLSW (born 8 October 1930), commonly known as John Cadogan, is a British scientist specialising in organic chemistry

### **John Cadogan - Wikipedia**

In chemistry, a coordination complex consists of a central atom or ion, which is usually metallic and is called the coordination centre, and a surrounding array of bound molecules or ions, that are in turn known as ligands or complexing agents. Many metal-containing compounds, especially those of transition metals, are coordination complexes. A coordination complex whose centre is a metal atom ...

A chemical element is a substance that contains only one type of atom. If a substance contains more than one type of atom, it is a compound. An element can be a solid, liquid or gas. The smallest particle of such an element is an atom. Atoms are made up of protons, neutrons, and electrons. Each element contains only one kind of atom. The number of protons in an atom is called the atomic number.

A relative atomic mass (also called atomic weight; symbol: A<sub>r</sub>) is a measure of how heavy atoms are. It is the ratio of the average mass per atom of an element from a given sample to 1/12 the mass of a carbon-12 atom. In other words, a relative atomic mass tells you the number of times an average atom of an element from a given sample is heavier than one-twelfth of an atom of carbon-12.

Chemiluminescence  
Chemiluminescence is a process by which light is produced as a result of a chemical reaction. It is a form of cold light, as the temperature of the reacting substances does not rise significantly. The process is often used in analytical chemistry to detect and measure the concentration of certain substances. It is also used in forensic science to identify and analyze evidence. The process is often used in analytical chemistry to detect and measure the concentration of certain substances. It is also used in forensic science to identify and analyze evidence.
